

DAY – 70

11 November 2025

The error says:

cannot import name 'load_and_train'

This means **your chatbot_logic.py does NOT contain any function named load_and_train()**, but your app.py is trying to import it.

Fix Options

You have **two choices**, pick one:

OPTION 1 — EASIEST (Remove load_and_train completely)

If you **don't need auto-reload**, delete load_and_train everywhere.

Step 1 — Remove it from import:

```
from chatbot_logic import get_response, check_reload_needed
```

Step 2 — Delete this block from app.py:

```
if check_reload_needed():  
    load_and_train()
```

This makes your backend clean and simple.

OPTION 2 — Add a dummy load_and_train() function

If your chatbot_logic.py expects training, add this inside it:

```
def load_and_train():  
    print("load_and_train() called — no training needed.")
```

This will stop the crash.

OPTION 3 — You send me FULL chatbot_logic.py

Then I will:

- Add missing functions
- Fix imports
- Remove errors
- Clean the logic
- Make sure Groq/Gemini work
- Make PDF/dataset loading correct
